

Generative AI has broad applications in fields that rely on human intellectual labour, including the creative sector. While there is massive public backlash from how AI is currently being implemented, the technology itself is enabling people to explore new avenues of what art can be, and is fundamentally going to reshape our relationship with creative labour, and labour in general. One way that AI is enabling artists that inspires me is how people are using it to create immersive experiences that are able to respond in real time; while it is a narrow application, I think the way that it is able to map data to enable embodied interactions, as well as responsive installations and architecture, is an avenue of creative expression that wasn't previously possible. Meander in Tapestry Hall, Cambridge, is an example of this; exploring the words of living and responsive architecture.

I don't think the rejection of AI by creative people is unfounded, but I don't think artists issues stem from the fact that it is a machine that is doing the work; instead having its roots in labour displacement and environmental concerns regarding the policy of its implementation. AI as a tool can be used by artists to explore the creative realm in ways that weren't before possible, and are not obvious even now. AI has potential for both good and evil, and unless we see and build a better tomorrow with it today, it won't come.
